Grizzly bear (<i>Ursus arctos horribilis</i>)	3	SAP10	Purchase bioimpedance meters and load cells for use by all field crews in order to measure fat levels and body condition for every bear captured. This will provide direct measures of how body condition varies spatially and temporally in response to management status and changes in foods. This will also provide baseline data across the range of the species in order to document changes in body condition in response to climate change as food and habitat availability change over time. These baseline data will be invaluable in the future as we compare them to future data to understand: 1) how climate change has impacted the species; and 2) how successful our efforts have been to mitigate for climate change impacts.
